AUTHORS:

Zasukhin, D.N., Shevkunova, Ye.A., Karulin, B.Ye. SOV/20-122-6-49/49

TITLE:

A Parasite Similar to Toxoplasma Discovered in the Brain of Voles  
(Parazit, skhodnyy s toxoplasmami, v golovnom mozgu polevok)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 122, Nr 6, pp 1129-1131 (USSR)

ABSTRACT:

Toxoplasmas have quite a large number of natural hosts. They were found in domestic as well as in wild animals (Refs 1,2). In Czechoslovakia C.Gavlik, I.Gibner, and M.Zasterova discovered these parasites in 15 kinds of wild animals. Antibodies were found in 8 kinds (lectures delivered on the occasion of the I Congress of the Czechoslovakian parasitologists, 1957). A toxoplasmosis as a huge epizootic in Western Germany was described (Ref 2). This disease was reported also from Scandinavia. The authors investigated the seats of the epidemic in 1957 in the Altayskiy kray at wild rodents and insectivora (Clethrionomys rufocanus, C.rutilus, Microtus oeconomus, Apodemus speciosus, and Sorex araneus). Smears of liver, brain, and spleen were taken. In the brain-smears of 14 animals parasites were found which morphologically exhibit a close resemblance to Toxoplasma gondii (Fig 1) (11 cases C. rufocanus, 3 cases C. rutilus). These two sorts of voles are the most wide spread ones in the district and occur the most frequently. There they are the main kinds in which

Card 1/3

SOV/20-122-6-49/49

A Parasite Similar to Toxoplasma Discovered in the Brain of Voles

the larvae of the ixodian ticks (*Ixodes persulcatus*, less *I. trianguliceps*) live as parasites. They are found most frequently in fir stands, in river valleys, and at old clearings which are overgrown by high grass. In the Turochakskiy district 217 animals were investigated. Besides the above mentioned ones, the following animals could be found among them: *Clethrionomys glareolus*, *Microtus arvalis*, *Apodemus agrarius*, Burunduk (Siberian squirrel). Among these animals only one (*Cl. nutilus*) was infected in the brain by parasites similar to those mentioned above. Only in 4 infected animals visible pathological modifications of the internal organs (enlargement and consolidation of the liver and a strong 3 to 7-fold enlargement of the spleen) could be found. The toxoplasmas are described (Fig. 1). They are irregularly distributed and locally form wide accumulations, as e.g. pseudocysts in the brain. Direct data on a pathogenic effect on man are still lacking. At present the systematic position cannot yet be finally judged. The last part of the paper gives a survey on related forms (Ref 4). - There are 1 figure and 4 references, 1 of which is Soviet.

Zasukhin, S.V., and Mel'nikov, V.M., Engineers

TITLE:

Some Urgent Problems in the Development of the Country's  
Water Resources

PERIODICAL:

Gidrotekhnika i melioratsiya, 1959, Nr 11, pp 3-8  
(USSR)

ABSTRACT:

This article deals with the development of water resources in the Soviet Union, particularly in relation to irrigation and water supply, drainage and reclamation work. The authors first review recent work in these fields and the current state of water resources in the country. For the period 1952-1958 over 9 billion rubles were invested in water resources, of which about 7 billion rubles were for irrigation. During this period the overall irrigated land area increased by 1,100 thousand hectares, 540,000 hectares of which were in the cotton growing regions. In this same period 2 million hectares of land were drained, and between 1956 and 1958, 480,000 hectares of land in Lithuania, Latvia, and Estonia were drained, in connection with large scale land reclamation

Card 1/4

SOV/99-59-11-1/15

Some Urgent Problems in the Development of the Country's  
Water Resources

projects in the Baltic states. As of January 1, 1959 there were about 150,000,000 hectares of irrigated pasture land in the entire USSR. Between 1954 and 1958 50,000 bore and cartesian wells were sunk. Among the technical facilities in use on water resource development, the authors mention 5000 excavators, 3,700 bulldozers and 3000 scrapers. 20 billion rubles are to be invested in water resources development during the 1959-1965 period; the irrigated land area will increase by 2 million hectares, by over 1 million hectares in the cotton growing republics alone, during this period, drainage work will embrace an area of approximately 4 million hectares, and 79 million hectares of pasture land are to be supplied with water. Reference is made to a resolution of the Council of Ministers of the USSR entitled "On Measures to Assure the Complex Mechanization of Work in Cotton Growing" which pointed to unsatisfactory utilization of land and water resources in irrigated areas; the authors also

Card 2/4

SOV/99-59-11-1/15

Some Urgent Problems in the Development of the  
Country's Water Resources

note non-utilization of land with a guaranteed water supply, particularly in Kazakhstan and the RSFSR, as well as in Azerbaydzhan. The problem of reducing the amount of manual labor in irrigation operations is treated; mechanization of cleaning irrigation systems of deposits and vegetation deserves special attention. The need for wider use of sprinkler systems is dealt with; the USSR, state the authors, has developed and successfully tested sprinkling equipment which should be put into serial production. Necessary also is expansion and improvement of the drainage system in order to combat soil salinity in the cotton growing regions of the republics of Central Asia, Kazakhstan and Azerbaydzhan. Another serious problem is water loss in irrigation systems through filtration. In addition it is noted that irrigation systems are poorly equipped with water distribution and measuring equipment; communications and transport facilities are inadequate at present.

Card 3/4

SOV/99-59-11-1/15

Some Urgent Problems in the Development of the  
Country's Water Resources

The authors dwell on the subject of necessary land reclamation and development work, particularly in areas outside the black soil belt. Improvement in the mechanization of this work, the development of new excavators and machinery for land reclamation work is also treated. The importance of rational utilization of pasture land in dry areas of the USSR, and water supply on this land is stressed. No less important is the problem of water supply to livestock farms and the need for increased mechanization in this field. The authors conclude with a note on the responsibility of state and collective farms vis-à-vis irrigation systems, and the role of scientific-research institutions in their further development.

TITLE: Peculiarities of the development of infection in an immune animal affected with tick-borne encephalitis

SOURCE: Voprosy virusologii, no. 4, 1966, 407-412

TOPIC TAGS: ~~disease diagnosis~~, virus disease, ~~tick-borne~~ encephalitis, animal parasit, diagnostic medicineABSTRACT: Results of the plaque method and fluorescent antibody tests showed that animals with active immunity to tick-borne encephalitis possess CNS resistance to the virus. Upon infection some viral reproduction was displayed with a brief viremia. The mechanism of the protective active of the vaccine is unclear but is apparently twofold, altering the reactivity of CNS cells and stimulating the formation of serum antibodies.

TITLE: Use of the plaque method for viruses of the tick-borne encephalitis complex

SOURCE: Voprosy virusologii, no. 5, 1966, 617-619

TOPIC TAGS: virus disease, ~~tick-borne~~ encephalitis, human ailment, plaque method, diagnostic medicine, CLINICAL MEDICINE

ABSTRACT: A method of adapting the plaque method to tissue-culture monolayers for determining tick-borne encephalitis virus was described. Adapted cells are added to a cell monolayer, incubated long enough for viruses to invade the cells, and then the cell-virus mixture is plated on nutritive media. Within hours, plaques peculiar to the virus strain appear and are counted. Orig. art. has: 1 table. [W.A. 50]
